10. Window Inventory	8

Companion to the design decisions (FR-10). All wireframes are schematic mock-ups of AppCUI windows/controls (rendered as vector figures in the PDF build). AppCUI model: a **desktop** hosts multiple **windows**; a bottom/top **app bar** shows global status; every action is reachable by keyboard, menu and mouse.

1. Design Principles

- **One Mission Control, many satellites.** The main window (tabs) is for global state; every *project* and every *session* can open as its own satellite window so parallel work is visible side by side on the desktop.
- **Live by default.** Every list/gauge subscribes to the event bus; no refresh buttons.
- **Nothing hidden.** Pending questions, write-queue depth and quota alarms are always one glance away (app bar + dashboard ticker).
- **Keyboard-first.** Global hotkeys work from any window; every form is tab-navigable.
- **Same core for TUI and CLI** — the TUI is a view; `maestro-cli` can do everything.

2. Global Chrome

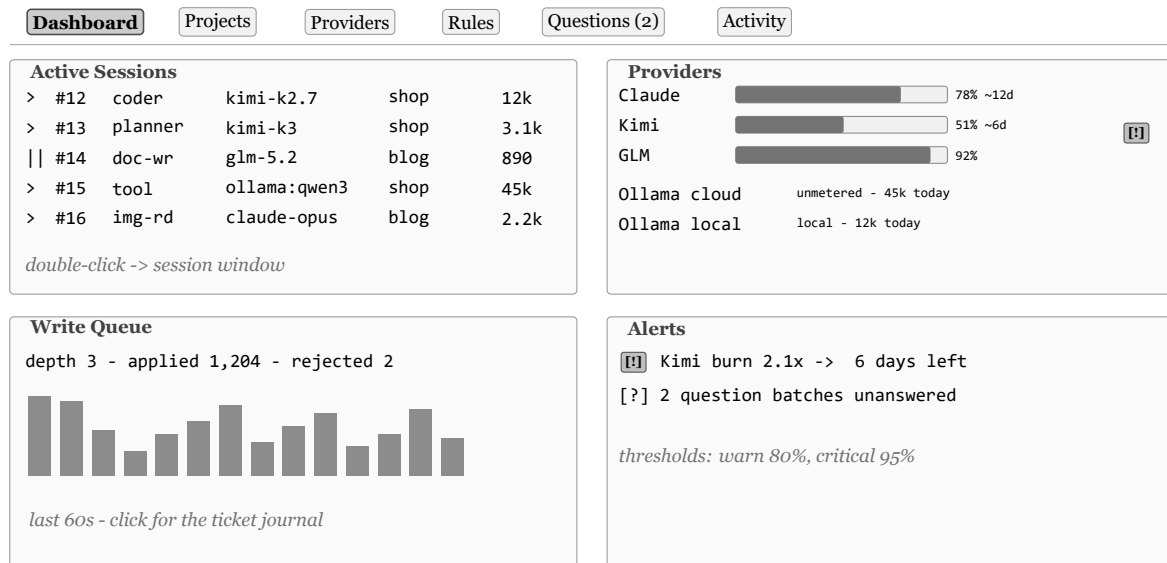

- **App bar segments** (left->right): active sessions • tokens today • cost today • write-queue depth • pending clarifications (click -> Interrogation Center) • active alerts (click -> alerts log) • clock. Segments are clickable buttons.
- **Menu map:**
 - *File*: New Project, Open Workspace, Import/Export Config, Quit
 - *Project*: Run/Pause/Resume, New Task, Interview, Regenerate AGENTS.md, Skills...
 - *Providers*: Add Provider, Detect CLIs, Health Check All, Quota Report
 - *Rules*: New Rule, Dry-Run, Import YAML
 - *Sessions*: Quick Chat, New Task Session, Pause All, Transcripts...
 - *View*: Mission Control, Tile Windows, Theme, Focus Mode
 - *Tools*: Settings, Config Doctor, Logs, Sandbox Allow-Lists
 - *Help*: Shortcuts, About

3. Mission Control (main window, opens maximized)

Tab control with 6 fixed tabs: **Dashboard** • **Projects** • **Providers** • **Rules** • **Questions** • **Activity**.

3.1 Dashboard tab

- Sessions listview: double-click -> session window; right-click -> pause/steer/kill/migrate.
- Provider gauges: progress bars + projected-exhaustion estimate; click -> provider window.
- Write queue: depth + applied/rejected counters + sparkline (GraphView); click -> ticket log.

3.2 Projects tab

Projects						
name	state	tasks	tok today	cost	questions	
shop-redesign	> running	2/6 done	60.3k	\$1.42	2 pending	
blog-engine	paused	1/4 done	3.1k	\$0.41	-	
scraper	[ok] done	5/5 done	-	\$2.07	-	

[Enter] open [Ctrl+N] new [Del] archive [I] interview

3.3 Providers tab

name	type	status	models	quota	latency	cost today
Claude	api	(*) ok	4	78% left	380ms	\$0.92
Kimi	api	(*) ok	3	51% left	520ms	\$0.44
claude	cli	(*) ok	-	parsed: 61%	-	-
ollama-local	ollama-local	(*) ok	20	unmetered	90ms	\$0.00
ollama-vc	ollama-remote	(*) ok	14	ssh tunnel	9ms	\$0.00

[+ Add] [Detect CLIs] [Health Check] *Enter -> provider detail (capability matrix, quota, tunnel)*

Provider window (double-click): tabs *Details* · *Models* · *Quota* · *Adapter*.

- Details: type, endpoint/CLI path, key reference (never the secret — [••• stored in keychain], [Change] [Test] buttons).
- Models: capability matrix (context, vision, tools, streaming, \$/M tok) — editable grid.
- Quota: plan limit, cycle, renewal date, source picker (api/parsed/manual/estimated), burn graph, alert thresholds.
- Adapter (CLI type only): invocation template, output parser, quota parser, overlay mode.

3.4 Rules tab

rules

```
(*) coder -> kimi / cloud / local
( ) planner -> kimi-k3 -> claude
( ) summarizer -> kimi-k3 / opus
( ) tool-runner -> ollama local
( ) img-reader -> mistral-small
```

*one rule per role + scope;
priority decides evaluation order*

editor

role:

when: (kimi)

then: 1.
2.
3.

scope: (*) all projects () shop

coder right now -> kimi/kimi-for-coding
skipped: none - kimi quota 51% >= min 20%

- Left: rule list (one per role+scope); right: condition builder (comboboxes + numeric fields) and **ordered fallback chain** editor.
- **Dry-run panel** evaluates the rule against live quota state and explains the choice.
- "YAML =>" toggle shows the canonical YAML (decision D2) with live two-way sync.

3.5 Questions tab — Interrogation Center

pending batches

```
> shop-redesign - auth (4q)
  blocks tasks #4, #7

blog-engine - seo (2q)
  advisory - nothing blocked
```

*answering unblocks paused tasks
automatically (FR-6.3)*

batch: shop-redesign - auth

1. Session store?
(*) JWT () cookies () other

2. Password reset via email?
[x] yes -> provider

3. Rate-limit login attempts?
() no (*) 5/min per IP

answers land in PRD.json clarifications[] with timestamps

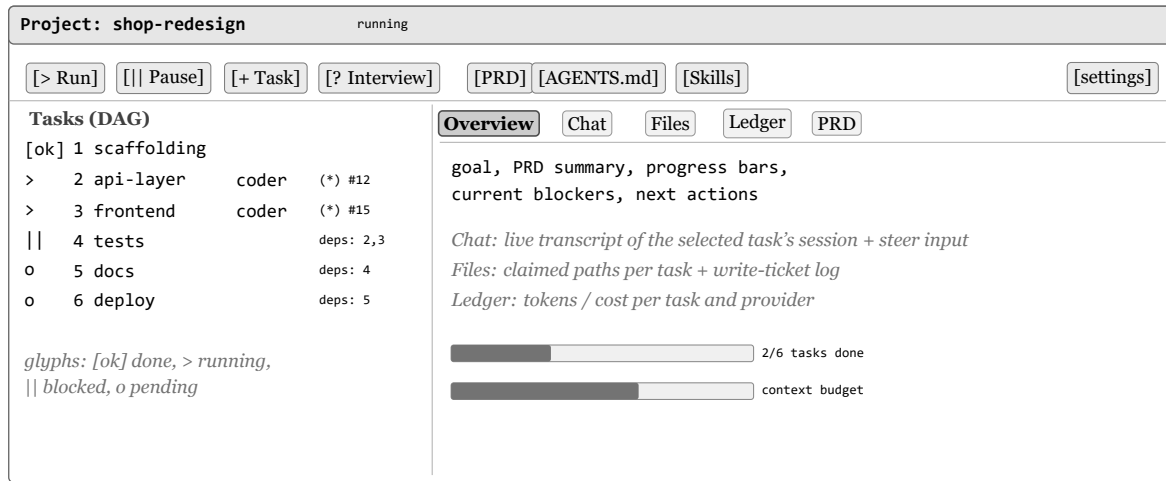

Answering unblocks paused tasks automatically (FR-6.3). "Later" keeps tasks paused but never loses the batch.

3.6 Activity tab

Chronological ledger stream (filterable by project/provider/type): tickets applied, rule decisions, quota events, migrations, alerts. Export CSV/JSON buttons.

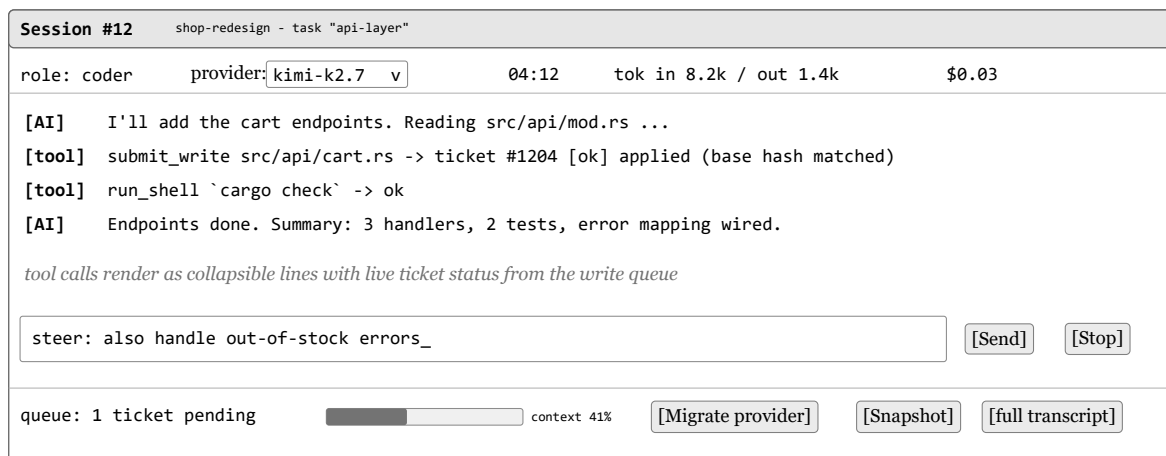

4. Project Window (satellite, one per project)

Opened from Projects tab (Enter) or `maestro project open shop`.

- Left: **TreeView of the DAG** — state glyphs ([ok] done, > running, || paused/blocked, o pending), role, live session id. Selecting a task binds the right-side tabs.
- Toolbar [?] **Interview** opens the clarification form for this project; **AGENTS.md** previews the generated file with diff on regeneration; **Skills** opens the suggestion/install panel.
- Right-side tabs (splitter draggable): Overview / Chat / Files / Ledger / (+PRD view).

4.1 Chat / Session view (the heart of single-model interaction)

- Transcript: RichTextField, streamed; tool calls rendered as collapsible lines with ticket status pulled live from the write queue.
- Provider combobox: switch model mid-session -> triggers structured-snapshot migration (decision D5), with confirmation.
- Bottom bar: queue state for this session's tickets, context-window usage, actions (Migrate / Snapshot / open full transcript in markdown viewer).

5. Quick Chat (single LLM, no project)

Ctrl+Q or Sessions -> Quick Chat. A lightweight window for ad-hoc conversation:

Quick Chat

provider: anthropic v

model: claude-haiku-4-5 v

78%

you summarise the write-queue design in 2 lines

[AI] Agents submit tickets; the orchestrator applies them per path in FIFO order with base-hash checks.

usage is ledgered against the provider - quotas stay honest

-

[Send]

[Close]

tok 1.2k - \$0.01 - session recorded in the ledger

- Token usage is still ledgered against the provider (quotas stay honest).
- **Promote to task:** converts the chat into a project task with the transcript as context seed. Attach ([clip]) adds files/images for vision-capable models.

6. Settings

Menu Tools -> Settings (F10). Modal window: left Accordion/ListBox of sections, right side shows the section's form. **[Save]** applies to TOML live; **[Defaults]** resets.

Settings inventory

Section	Keys
General	workspace root, default project template, language/locale, autostart behavior, check for updates
Appearance	theme (dark/light/custom), true-color toggle, font-size hint, dashboard density, confirm-on-exit
Parallelism	global session cap (default: CPU heuristic, D6), per-provider concurrency limits, write-queue batch size, per-project fairness quota
Quotas & alerts	warn thresholds (default 80/95%), alert action (notify / auto-switch rule / pause role), burn-rate window, renewal reminders
Rules	default question mode (thorough/balanced/minimal — FR-6.4), unmatched-role behavior (ask / cheapest / fail), rule conflict precedence
Secrets	backend: keychain <-> encrypted vault, vault path, master-password timeout, env-var passthrough allow-list
Sandbox & security	shell allow-list per project, network access for tool-runner, overlay mode for CLI adapters (D3), redaction level
Projects	default DAG parallelism, auto git checkpoints on/off, AGENTS.md regeneration policy (ask/auto), skill registry paths
Storage	config dir, SQLite path, transcript retention days, ledger export format, backup on exit
Notifications	TUI popups on/off, OS toast on/off, sound, quiet hours
Keybindings	full remapping table (searchable)
Headless/API	default --json, NDJSON watch toggle, exit-code verbosity
Advanced	log level, event-bus buffer size, experimental flags, reset all state

7. Interaction Flows

7.1 First run (onboarding wizard, runs once)

- Welcome -> pick workspace root & theme.
- **Detect providers:** scans PATH for claude/codex/gemini/ollama, probes localhost:11434; shows found list with checkboxes.
- **Add API providers:** endpoint + key (stored to keychain, FR-2) -> auth test -> model discovery.
- **Quota setup:** for each provider pick source (auto / manual budget) + plan limits.
- **Default rules:** proposed from capabilities (e.g. tool-runner -> ollama local); user confirms in the rule editor.
- Done -> Mission Control. maestro config doctor summary shown.

7.2 New project

- Ctrl+N -> wizard: name, dir, stack, git init.
- **Interview** (interrogator role, FR-6): batched forms; answers stream into PRD.json.
- Maestro drafts **PRD.md** -> user reviews in markdown tab -> approve -> PRD.json compiled.
- **AGENTS.md + skill suggestions** generated; user checks which skills to install.
- **Task DAG proposal** shown in the project's tree; user edits/reorders -> **Run**.
- Sessions spawn per rule routing; dashboard shows them; questions may reappear mid-flight in the app bar ([?] badge).

7.3 Quota-exceeded event (no user action needed)

- Provider returns 429 / parsed quota hits threshold -> rule re-evaluates (FR-3.3).
- Session migrates via structured snapshot (D5); transcript gains a — migrated kimi-k2.7 -> glm-5.2 — marker.
- App bar [!] badge + notification; Activity tab records the decision and its reason.

7.4 Steering a running agent

Open session window -> type in steer box -> message injected into agent loop. ■ Stop pauses with snapshot; resume continues with context intact.

8. Keybindings (defaults, remappable)

Key	Action
Ctrl+Q	Quick Chat
Ctrl+N	New Project
F10	Settings
F1..F6	Mission Control tabs (Dashboard...Activity)
Ctrl+Enter	Send (chat/steer)
Ctrl+P	Command palette (jump to project/provider/rule/session)
Ctrl+D	Dry-run rule under cursor
Ctrl+T	Tile all satellite windows
Esc	Close dialog / blur input
?	Shortcuts overlay

9. AppCUI Control Mapping

Need	AppCUI control
Tabs everywhere	Tab
Sessions/providers/projects tables	ListView (columns, sort)
Task DAG	TreeView + custom glyphs
Quota gauges	ProgressBar + GraphView (burn sparklines)
PRD view	Markdown viewer
Chat transcript	RichTextField (read-only, appended)
Steer/chat input	TextField (multiline) + Button
Rule builder	ComboBox, NumericField, ListBox + up/down
Settings sections	Accordion / ListBox + panel swap
Project window panes	Splitter
Global status	AppBar segments
Wizards/onboarding	modal Windows + Buttons, CheckBox, RadioButton
Questions forms	generated RadioButton/CheckBox/TextField/DatePicker
Toasts/alerts	notification dialogs + app bar badges
Theming	built-in themes, true-color

10. Window Inventory

Window	Kind	Opened from
Mission Control	main (maximized)	startup
Onboarding wizard	modal	first run / Tools
Project window	satellite	Projects tab, maestro project open
Session/Chat window	satellite	dashboard/chat tab, Quick Chat promote
Quick Chat	satellite	Ctrl+Q
Provider window	modal-ish	Providers tab
Provider wizard	modal	Providers -> Add
Rule editor	tab panel	Rules tab
Interrogation form	panel/modal	Questions tab, app bar [?]
Settings	modal	F10
Transcript viewer	satellite	session -> [log] full
File/picker dialogs	stock AppCUI	wizards
